C; Comment: Thrombin, which cleaves bonds after Arg and Lys, converts fibrinogen to fibri C; Comment: Prothrombin is activated on the surface of a phospholipid membrane that binds ter 314-Arg, are released in natural blood clotting.
C; Comment: The cleavage after Arg-198, observed in vitro, does not occur in plasma.
C; Comment: The gamma-carboxyglutamyl residues bind calcium ions, result from the carboxyglutamyl residues bind calcium ions, result from the carboxyglutamyl charged phospholipid membrane surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Molecule type: protein

                                                                                                               "SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.

-I ISSUE SPECIFICITY: Plasma; synthesized in the liver.
-I FTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.
-I MISCELLANGOUS: carcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the trombin-thrombomodulin complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Blood coagulation; Glycoprotein; Serine protease;

SUBUNIT: SYNTHESIZED AS A SINGLE CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE BUXZME IS THEN ACTIVATED BY THROWENIN, WHICH CLEAVES A FERRADECAPEPTIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS STRONGLY PROMOTED BY THROMBONDOULIN.

TISSUE SPECIFICITY: PLASMA, SYNTHESIZED IN THE LIVER.

FTM: THE VITAMIN K-DEPENDENT, ENZYMATIC CARBOXYLATION OF SOME MISCELLANEOUS: CALCIUM.

MISCELLANEOUS: CALCIUM ALSO BINDS, WITH STRONGER AFFINITY TO ANOTHER SITE, BEYOND THE GLAD DOMAIN. THIS GLA-INDEPENDENT BINDING SITE IS NECESSARY FOR THE READ DOMAIN. THIS GLA-INDEPENDENT BINDING SITE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PROCESSING, AND CALCIUM-BINDING DATA.

-1- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.
--- CATALYTIC ACTIVITY: Preferential cleavage: Arg-1-Thr and then Arg-1-Ile bonds in prothrombin to form thrombin.
--- SUBGNUTT: THE THO CHALMS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY 1 OR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sclander Sunnerhagen M., Ullner M., Persson E., Teleman O., Stenflo J., Drakenberg T.; Indee M.            "An endoprotease homologous to the blood clotting factor X as a determinant of viral tropism in chick embryo.";

EMBO '9 :4189-4195(1990).

-! FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrompin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.
-! FUNCTION: VAP CLEAVES THE FUSION PROTEINS OF SENDAI VIRUS, NDV, STIE, AND PLAYS A KEY ROLE IN THE VIRAL SPREADING IN THE ALLANTOIC
                                                                                                                                                                                                    -I- SUBUNIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR WAS BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY 1 OR
                                                                                                                                                                                                                                                                                                                                   -!- FTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY), OR BY FACTOR VIIA (IN THE EXTRINSIC PATHWAY).
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glycoprotein; Hydrolase; Serine protease; Plasma; Blood coagulation;

**Taructural basis for chemical inhibition of human blood coagulation

**La Proc. Natl. Acad. Sci. U.S.A. 95:6830-6635(1998).

**C -1- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

**C -1- CATALYTIC ACTIVITY: Preferential cleavage: Arg-1-Thr and then Arg-1-ILe bonds in prothrombin to form thrombin.

**Arg-1-ILe bonds in prothrombin to form thrombin.

**INDINIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY TWO ARG RESIDUES AND ARE HELD TOGETHER BY I OR WARD INTERTEDRE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- PTM: N- AND O-GLYCOSYLATED.
-!- PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY), OR BY FACTOR VIIA (IN THE EXTRINSIC PATHWAY).
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.

Mutat. Suppl. 1:5189-5191(1998).

-1- FUNCTION: CIRCULATES IN THE BLOOD IN A ZYMOGEN FORM. FACTOR VII IS CONVERTED TO FACTOR VIIA BY FACTOR XA, FACTOR XIIA, FACTOR IXA, OR THROMEIN BY MINOR PROTEOLYSIS. IN THE PRESENCE OF TISSUE FACTOR AND CALCIUM IONS, FACTOR VIIA THEN CONVERTS FACTOR X TO FACTOR XA BY LIMITED PROTEOLYSIS. FACTOR VIIA WILL ALSO CONVERT FACTOR IX TO FACTOR IXA IN THE PRESENCE OF TISSUE FACTOR VIOLATION. CALCIUM.
